

Formatting Plots

Setup

```
%matplotlib inline
import matplotlib.pyplot as plt
import numpy as np
import pandas as pd
import seaborn as sns

fb = pd.read_csv(
    'fb_stock_prices_2018.csv', index_col='date', parse_dates=True
)
```

Titles and Axis Labels

- plt.suptitle() adds a title to plots and subplots
- plt.title() adds a title to a single plot. Note if you use subplots, it will only put the title on the last subplot, so you will need to use
- plt.xlabel() labels the x-axis
- plt.ylabel() labels the y-axis

plt.suptitle() vs. plt.title()

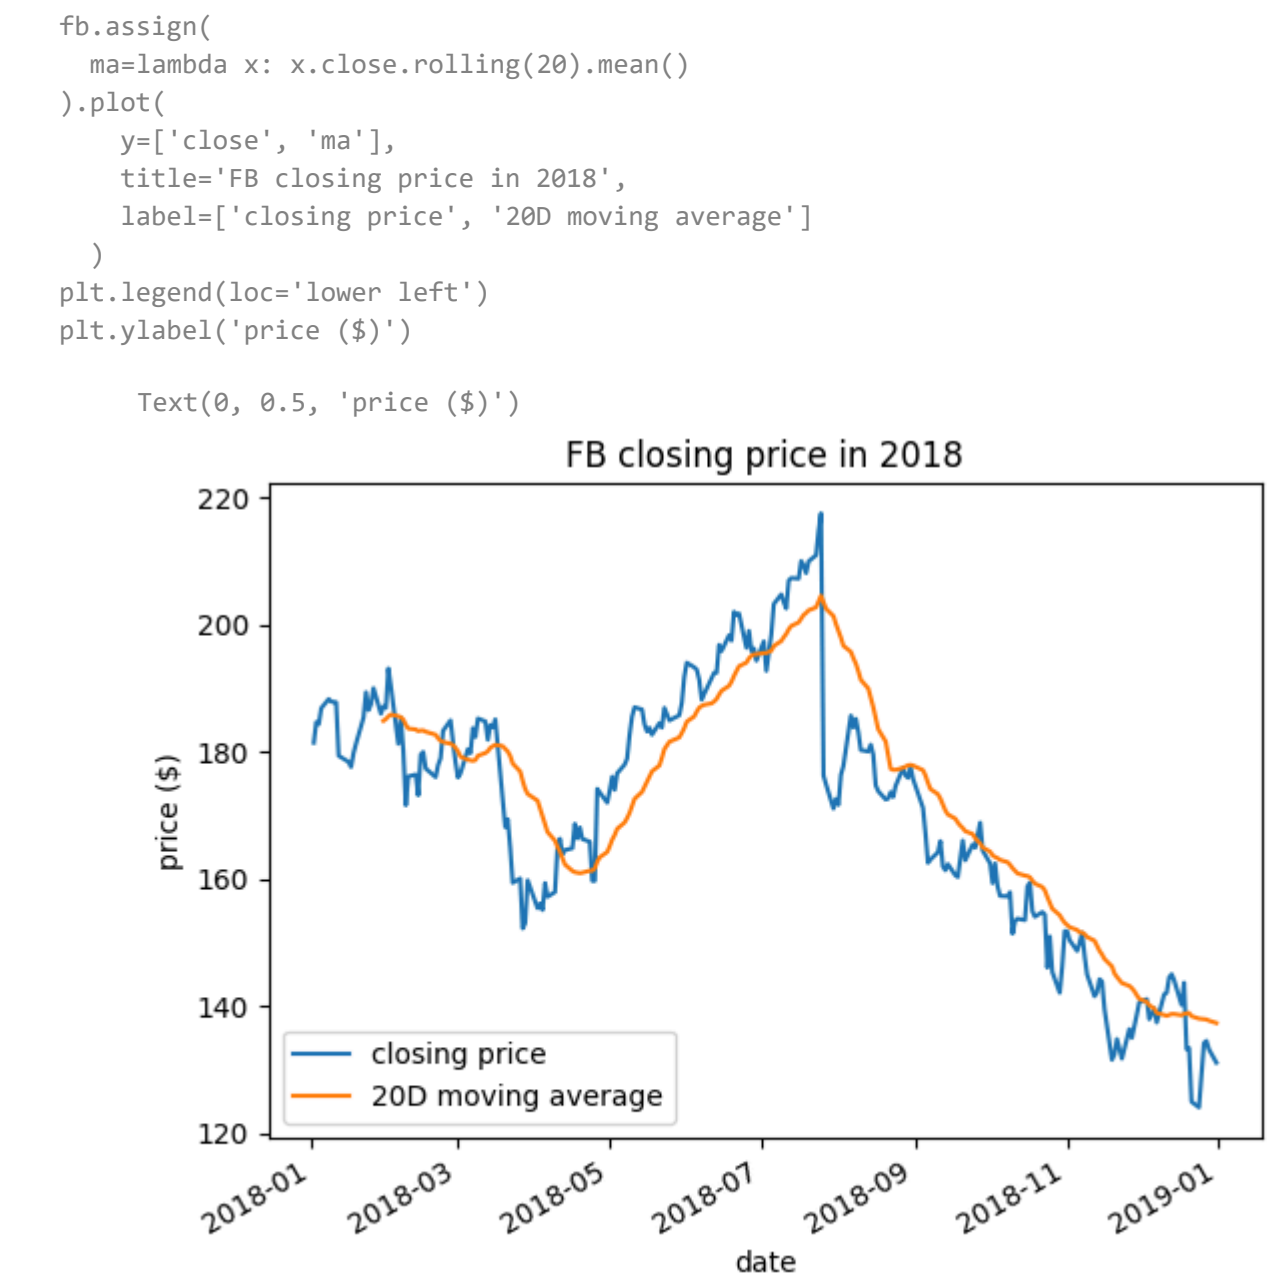

Simply getting into the habit of using plt.suptitle() instead of plt.title() will save you this confusion:

Legends

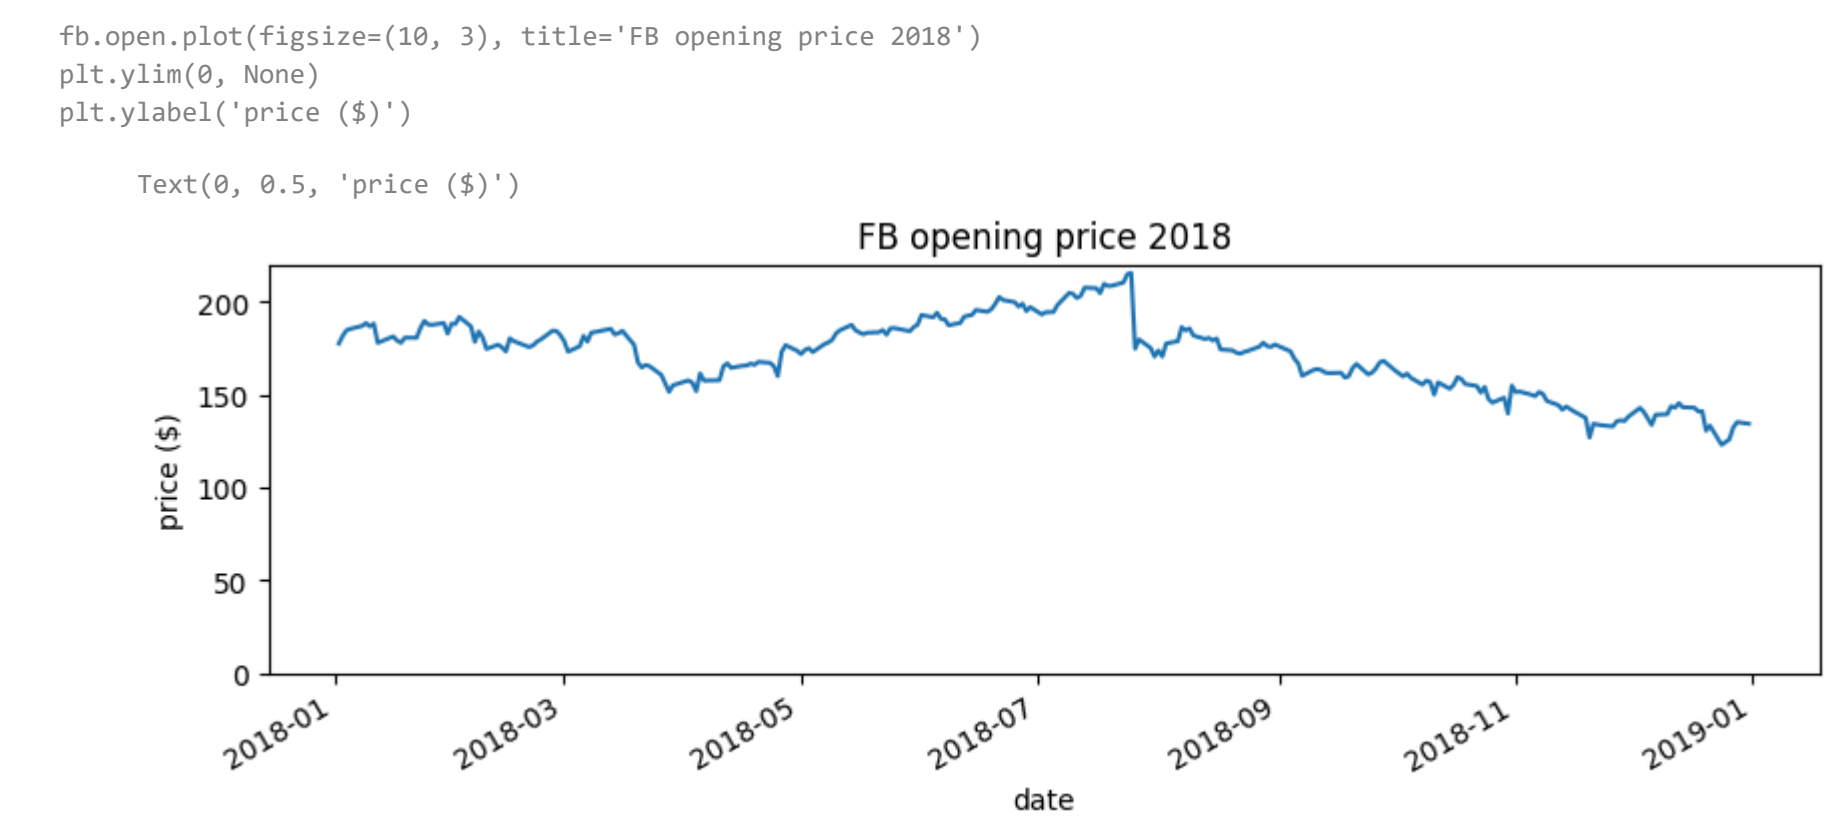

plt.legend() adds a legend to the plot. We can specify where to place it with the loc parameter

Formatting Axes

Specifying axis limits

plt.xlim() and plt.ylim() can be used to specify the minimum and maximum values for the axis. Passing None will have matplotlib determine the limit.

Formatting the Axis Ticks

We can use plt.xticks() and plt.yticks() to provide tick labels and specify, which ticks to show. Here, we show every other month

```
ValueError                                Traceback (most recent call last)
<ipython-input-8-dcb2ef525d0e> in <cell line: 5>()
      3 fb.open.plot(figsize=(10, 3), rot=0, title='FB opening price 2018')
      4 locs, labels = plt.xticks()
----> 5 plt.xticks(locs + 15, calendar.month_name[1:12])
      6 plt.ylabel('price ($)')

⬆ 3 frames
/usr/local/lib/python3.10/dist-packages/matplotlib/axis.py in set_ticklabels(self, labels, minor, fontdict, **kwargs)
    1967         # remove all tick labels, so only error for > 0 labels
    1968         if len(locator.locs) != len(labels) and len(labels) != 0:
-> 1969             raise ValueError(
    1970                 "The number of FixedLocator locations"
    1971                 f" ({len(locator.locs)}), usually from a call to"

ValueError: The number of FixedLocator locations (7), usually from a call to set_ticks, does not match the number of labels (6).
```

Using ticker

```
import matplotlib.ticker as ticker

ax = fb.close.plot(
    figsize=(10, 4),
    title='Facebook Closing Price as Percentage of Highest Price in Time Range'
)
ax.yaxis.set_major_formatter(
    ticker.PercentFormatter(xmax=fb.high.max())
)
ax.set_yticks([
    fb.high.max()*pct for pct in np.linspace(0.6, 1, num=5)
]) # show round percentages only (60%, 80%, etc.)
ax.set_ylabel(f'percent of highest price (${fb.high.max()})')

Text(0, 0.5, 'percent of highest price (${218.62})')
```

MultipleLocator

The points only take on integer values for x

```
fig, ax = plt.subplots(1, 1)
np.random.seed(0)
ax.plot(np.tile(np.arange(0, 5), 10), np.random.rand(50), 'ko')
```

If we don't want to show decimal values on the x-axis, we can use the MultipleLocator. This will give ticks for all multiples of a number specified with the base parameter. To get integer values, we use base=1 :

```
fig, ax = plt.subplots(1, 1)
np.random.seed(0)
ax.plot(np.tile(np.arange(0, 5), 10), np.random.rand(50), 'ko')
ax.get_xaxis().set_major_locator(
    ticker.MultipleLocator(base=1)
)
```
